Microsoft C++/CLI, a managed version of the C++ language, was introduced in 2003 and became available with Visual Studio 2005. In contrast to managed code (sometimes referred to as managed code), unmanaged code is written in C, C++ or other languages, and the compiled code is called an unmanaged executable file. The advantage of managed code is that it is faster than unmanaged code and allows for better code reuse. Managed code is usually used for developing apps on Windows or other platforms. While unmanaged code is faster, managed code is not as flexible or as easy to use. In computer science, software engineering, and related fields, a software component or file is a piece of software that may be loaded, sent over the network, distributed or compiled to a machine (a process is usually performed before the machine, but can also occur after) with an operating system and all its prerequisites to be able to run the code or software component. Microsoft Windows and DOS software is usually not bundled with AutoCAD but is accessible via a separate application. Windows versions of AutoCAD can be found here. Open and closed CAD software applications are software programs that enable a user to create or modify 2D or 3D drawings (CAD drawings). Open Source CAD software means CAD software that is free to use and distribute. Open Source CAD software can be freely downloaded, installed, modified, and redistributed for free. A kit is an assembly of items that enables a user to complete a piece of work. A kit can contain any combination of software or hardware. Examples include software development kits, firmware development kits, circuit design kits, electromechanical design kits, drafting kits, and CAD kits. A CAD kit is a software bundle of tools that enable a user to create or modify 2D or 3D drawings (CAD drawings). OpenStreetMap (OSM) is a community-driven map of the world, which anybody can edit and contribute to. Founded in 2004 by Markus Bressel, OSM is a free and open-source mapping software that facilitates the collection and processing of geospatial data. OpenStreetMap is commonly used to make maps available free of copyright or database restrictions. OpenStreetMap is an important source of geographical data. As an open source project, it depends on volunteers and the use of open standards.

Symbols Symbols are geometric objects that symbolize an object or group of objects. Symbols are generally used for display purposes, and are designed to look like a real object (for example, a door on a model of a building). As AutoCAD provides a number of ways to define symbols, there are many ways to insert them into a drawing. Symbols have various shapes, or uses,

including a rectangle, oval, diamond, arrow, triangle, circle, arrowhead, square, and circle as shown in the table below. The symbol data type Symbols are stored in the Symbol Data Type (SDT). The SDT is a special data type in AutoCAD that allows for the storage of geometric data such as points, lines, circles, and polygons. Symbol attributes Symbols may have certain attributes that, when applied, modify the symbol. Attributes are attributes that modify the object to which they are applied. Attributes modify the geometry of the symbol or the object it represents, or both. Attributes can be changed at the point, line, or symbol level. Attributes can also be of many types, for example: Shape, fill, line pattern, line color, line width, layer, and text. Symbol properties Symbols may have various properties that are of various types and that modify how the object is displayed. Properties are properties that modify the appearance of an object such as the symbol, the object that the symbol represents, or both. Properties are applied at the object level. Relationships Symbols can have relationships with other symbols in a drawing. A relationship is a definition that associates two objects or sets of objects as a group. For example, a group of walls may be joined together to represent a single building. Mapped Data Symbols can store their properties in a graphical map. Mapped data is data that is stored in a format which is invisible to the user, but can be accessed and used by the application. For example, symbols with text information are stored in a graphical map as text with a certain font style. The data is then used by the application to apply the symbol style and font style to the symbols. Geometric Symbols Symbols can be geometric objects, such as lines, arcs, and splines. They can also be symbols of geometric objects. For example, a circle symbol that represents an arc is a symbol of
