The term “Autodesk” can be used as a generic term for AutoCAD or any other software developed by Autodesk. When referring to AutoCAD in this article, the term “AutoCAD” means the primary AutoCAD program developed by Autodesk. Command Line Interface Direct3D DirectDraw Surface DirectWrite Dynamic Language Runtime Visual Basic for Applications Visual LISP Features General features The user interface is written in Application Programming Interface (API), which is specifically designed to be very user friendly, with a simple to learn, but very powerful programming language. The AutoCAD product family includes many features that allow users to customise and automate their experience with AutoCAD. These features are provided by a combination of software libraries, called APIs (application programming interfaces), and programming languages. An application programming interface (API) is a set of rules and guidelines

that a programmer uses to access and change the functions and services of a software program. An API is similar to the interface between the application and operating system. In the context of AutoCAD, an API can be compared to the GUI or an operating system. An API is a set of "rules" or standards that is used to access the software program, and a special programming language is used to accomplish this task. Another way to think of an API is that the underlying software code or operating system calls are abstracted away from the programmer. The programmer is actually working on the API rather than the actual functions and operations that are taking place on the drawing itself. There are several different APIs in AutoCAD. They are C++, Visual LISP, Visual Basic for Applications (VBA), and the ObjectARX API. Each of these APIs allows the user to interact with the drawing program in a different way. For example, the C++ API uses C++ language programming to interact with AutoCAD, the Visual LISP API uses Visual LISP programming to interact with AutoCAD, and the Visual Basic for Applications API uses VBA programming to interact with AutoCAD. AutoCAD is a large, complex program, so it is not always possible to provide all features through a single API. Thus, for example, VBA provides a high-level interface for customizing AutoCAD, while Visual LISP provides a lower-level interface. While each of the APIs may be used to perform a single function, all the APIs can be used together to work together on the drawing. To explain a bit more about the workings of the APIs, we will use an example. We will use a small, fictional company, Macro Gentry and Micro Designs, to describe how the Auto af5dca3d97
