How often have you been working on a design project, only to discover your privacy settings, your name, email, and other user details are visible to Adobe in the background? How many of those products do you use? The number is probably in the thousands. We're talking about a company that has been doing this for 20 years, but now it seems they're not even trying to hide it. Of course, the power of the product is in the hands of the user, but it still freaks me out to know there's a company I can't be sure is not spying on me. There are also a few other interesting things of note. There are some new filters, including a new one that automatically creates a fogged out effect. Names in the labels panel were updated, including the creation of a section called "Layers". There are also other changes, but I'm not going into those because there's nothing that will change whether or not you decide to buy Photoshop. Lightroom 5 is a major update with the main focus being to improve performance and make it easier to work with images. In some respects, this is a complete re-write, and there's a lot to get into. Here's what I found when I started to work with the new version of Lightroom 5. As opposed to previous versions of Lightroom, I have a feeling this one is for people who are just getting into the workflow. There is also a new Look View option with the ability to turn the screen black and white, sepia, or grayscale. There is also the option to see what After Effects would look like with various effects. Lightroom can also now be used for people who want to make a video tutorial.

But Adobe didn't stop here: the company is constantly coming up with more and more powerful features and tools for artists to unleash their creative potential. Without going too much into details, it is clear that this announcement on 3D is the latest in a series of ways Adobe is planning to streamline its products based on a new core design. Having gone through this transition of being a multimedia juggernaut into a developer-driven company, it is clear that creative professionals are their main concern, which is why we made a shift over the years to focus more on them. The decision to move away from having the 3D feature set was made for the same purpose, that is to make certain the company is giving greater concentration to growing its developer-driven community. And believe me, Adobe will continue to focus on its developers, starting with a \$100 million project . We will be able to deliver even more creative features to the world to allow them to realize their vision. Whilst we are sure that you will understand this decision perfectly well, we want to go beyond that by providing even more information to you about the way the company is evolving, so you can continue making the most of the Photoshop you already love. And since we know that you are a loyal Photoshop family, we wanted to provide you with an update on our plans for the long-term roadmap. And that is why we reached the decision to discontinue the 3D feature set. We have always believed that in the future, 3D editing will

support the native GPU APIs. Our 3D workflows and associated features work great on these modern APIs, and we will continue to evolve our 3D and 2D features to offer even more performance, faster and easier ways to work. Meanwhile, we are looking forward to seeing happen with the Substance Universe in the third-party marketplace. But most importantly, we are committed to working closely with the wider community to ensure that new classes of innovative solutions are developed and focused specifically on the needs of digital artists worldwide.

The most exciting thing for this year's release of Photoshop is the return of augmented reality. Adobe introduced a new format called Adobe AR for the distance-learning version of Photoshop in 2018, and Photoshop for AR got a significant overhaul in the 2020 version. With AR, you can share 3D content that you've created with the folks around you. Adobe AR for Photoshop also supports volume rendering, which makes it possible to turn diffuse or specular surfaces into 3-D surfaces of metal, marble, or other natural and synthetic materials. The 2019 release of the program adds a new feature called 3D Extrusion. This command can be used to create 3-D objects. It can also be used to transfer textures from an image into a 3D layer, Adobe has added a new, more compact, 3D rendering application. You can make a 3D mesh object, a child object, or you can change a current skeleton in the Mesh workspace. Then you can apply it to any layer—and you can edit it using standard editing tools. In September, Adobe released a 3D art feature that lets anyone reconstruct and “forge” 3D objects so they can be edited and viewed as traditional 2D flat objects on top of 3D mesh. The tool was designed for artistic sculpting of 3D content. The new 3D text feature lets designers create original 3D text as a font face using nodes that have text styles. Anyone who uses classic text in traditional documents can benefit from this. Adobe designers can add lenses to their photomanipulation tool. Lenses are like virtual overlay filters that let you see the result of different camera angles and types of lighting in-line with a subject or the image as a whole. You can even add a lens to do previsualization. Adobe Lens Studio has greater functionality when used with Photoshop.
