Today, with higher-speed scanning technology becoming more affordable, we can print out pictures from our desktop/laptop and have them printed at local photo labs using high-resolution inkjet printing. We can even photograph our pictures on digital cameras and transfer them from our PCs to a photo lab. When we have these pictures printed, we can cut them with scissors. No offense to you guys who still use scissors, but for the common man, today's picture cutting involves much more sophisticated tech.

Adobe has added many of its most popular features, such as artistic effects, luminance, and color adjustments and abilities to layers. For example, you can now create layers with an artistic fill effect, make any layer's luminance equal to another layer, or copy and paste art and text created in different applications. Unlike similar features previously available in Adobe's line of popular (Illustrator) and (logically named, but not Photoshop) software, these new features work across all layers. The feature works on both type and vector-based artwork. You can also apply most of Photoshop's adjustment types to the Artistic Effects panel. With its ever-deepening integration with AI and machine learning, Photoshop is now more AI-ready than ever. Much of this is based on solving problems with deep learning, or artificial intelligence (AI). Deep learning is the way a computer can be taught to learn similar to how humans can. The performance of hard-to-update software stacks now virtually eliminates irritating bugs or crashes caused by outdated Mac systems. With better performance, Adobe has been able to push the tools on the new Macs until they are released. Now, all new features of Photoshop will be available for Tier 2 (2.2GHz Dual Core CPUs and 2GB of RAM) and Tier 3 (4GB dual-core CPUs and 4GB RAM) Macs. Builds of the core apps for CS6 are available for the new Macs, but there is no support for 64-bit Intel processors until after macOS 10.14 Mojave is released, which is expected in September.
